

TERRIFYING TORNADOS

just a sec!

Gavin a little help!

April 26th, 1999
Gavin's Dad asks Gavin for moving help

Are we there yet?

6 days later...

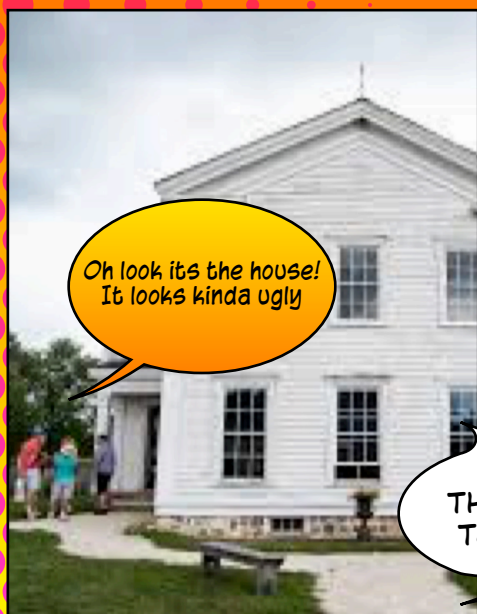

How about now?

Welcome to Oklahoma

Oh no I am so scared

Well there are many ways to stay safe during a tornado. go underground. Some schools.. ***RUMBLE***

Oh look its the house! It looks kinda ugly

BREAKING NEWS WITH JESSICA HORN
THERE HAS BEEN A REPORT OF A TORNADO COMING TOWARD OKLAHOMA CITY!

Offices and schools. There are ways to avoid getting killed during a tornado. Don't go in cars or outside and try to stay low. There are tornado watches that look out for tornadoes.

Huhuh! We made it

Oh I think I get it now. Tornadoes form when cold and hot air mix, tornadoes usually happen in the middle of the U.S.A when the hot air from the West and the cold air from the East mix. Tornadoes are short-lived terror, a Tornado usually lasts an hour but every second is terrifying. If you live in an area where tornadoes happen, think about moving to N.Y or somewhere tornadoes don't hit. A tornado can wipe out a whole town or even a whole CITY!!!

One way

Meteorologists measure, is using weather satellites to predict if any tornadoes are coming their way. A But doppler radar is one of the best ways to detect powerful tornadoes.

Cool!!!

The column is called funnel cloud or vortex. It can be hundreds of feet wide. It sucks up objects as it moves across the land. Once the tornado reaches the ground a lot of them move along the ground somewhere from 10-20 miles (16-32 km) per hour. Tornadoes usually travel from west to east and move in either a straight or curved path.

It's a system that uses waves of energy to sense objects. Another way to predict a tornado is studying what happened in the past to predict what is coming. A tornado comes twirling out from the base of rotating thunder clouds. The whirling column of water droplets looks like a cone, pillar or tube.

Hooray!!

Hooray!!

Hooray!!
